

# QUANTUM-SAFE TABLETOP EXERCISE: SENIOR TECHNICAL ADVISOR'S HANDOUT

## Purpose

Welcome to the Quantum-Safe Tabletop Exercise. This document contains the agenda and handouts that relate to the exercise.

Feel free to use this handout to take notes throughout the exercise.

## Agenda

0915-0930 Introduction and expectations

0930-1130 Exercise (including a break)

1130-1200 Debrief and feedback

1200-1300 Networking and lunch

## Definitions

Cryptography	The process of <b>making plain information unreadable, as well as to convert it back to a readable form</b> . This includes constructs such as encryption, digital signatures, hashing, etc. that are used to authenticate the source and protect the confidentiality and integrity of information within and across a variety of information and communications technologies.
Cybersecurity	The <b>protection of digital information and the infrastructure on which it resides</b> . More specifically, cybersecurity includes the body of technologies, processes, practices and response and mitigation measures designed to protect networks, computers, programs and data from attack, damage or unauthorized access so as to ensure confidentiality, integrity and availability.
Deliberate cyber threat	A cyber threat actor who, using the internet, takes advantage of a known vulnerability for the purposes of <b>exploiting a network and the information the network carries</b> .
Encryption	<b>Converting (encoding) information from 'plaintext' to 'ciphertext'</b> to hide its content and prevent unauthorized access or manipulation.
Quantum computing	Exploits quantum properties to store and manipulate information that enables mathematical, optimization, and search problems <b>much faster than conventional computers</b> .
Quantum threat	Quantum computers used in ways that <b>can break or weaken widely used cryptographic schemes</b> .
Quantum-safe cryptography	The use of new cryptographic tools, whether conventional or quantum in nature, designed to be <b>resistant to quantum attacks</b> .
Quantum-safe	A state of an information system where <b>quantum threats have been mitigated</b> through either traditional or new quantum-safe practices, processes and technologies.

## Quantum Readiness Inbox x

**To: Senior Tech Advisor@yourorg.ca**

Good morning, I recently had a discussion with a colleague at an annual IT conference and they showed me a notice from the Canadian Centre for Cyber Security on the quantum threat. After reading it, I did a quick assessment of our cybersecurity posture. I know that the threat from actual quantum computing may be 15 years out. However, I need to understand the longer-term implications and I also need to inform the Board if there are going to be significant costs that we need to account for.

I'd like you to find an expert in this field and get them to have a look and provide me with a short brief on our current cybersecurity posture and what we might be looking at to ensure that we understand the future risks.

CIO

- What are your first reactions?
- What information systems or data do you have that rely on quantum vulnerable cryptography and encryption?
- Where would you start?
- What expertise do you have access to?

## Handout 2 – Consultant Briefing

- *15 years is a stretch it could be far earlier*
- *All PKI/asymmetric key are potentially at risk*
- *NIST is defining Q-S standards upon which a vendor list will be based*
- *There is an additional threat of ‘harvest now/decrypt later’ that you should consider*
- *We can do the quantum-risk assessment and provide prioritized actions*

- What are your concerns now?
- What are the initial implications of this new information?
- What do you think your next steps are?

### **Is your business ready for the quantum threat?**

While experts have yet to agree on exactly when the quantum threat will be realized, conservative estimates hover around 15 years. Many experts suggest, however, that it could be considerably sooner given the level of investment and innovation within certain nation states and the private sector.

Organizations are urged to identify quantum vulnerable systems, evaluate what is at risk and start planning for the eventual threats.

- What information systems or data do you have that rely on quantum vulnerable cryptography and encryption?
- What exposures or risks are there to quantum threats?
- As the threat is 15 years out, what are your immediate concerns if any?

## Handout 4 – Q-Bit Times Article

# The -Bit Times

High-tech news direct to your inbox on digital parchment

**Breaking News** - The tech world has been rocked with the recent statement by a medium-sized technology firm that indicated that they are confident that they will have commercially viable quantum capability within the next five years. While many have their doubts and suggest that this is an attempt to attain more investment, government officials have assessed the evidence and agree that quantum computing could be a reality sooner than we thought.

- How does this change your plan?
- What should be your first steps?

**2026 - The state of quantum-computing in Canada: How are businesses fairing on preparing for the emerging threat?**

It's been a few short years since we announced how businesses should be preparing for the quantum threat. Despite this, a recent survey indicated that less than 50% of businesses have taken the minimum actions required to protect their systems and data from what will soon be available to those who can afford it - a quantum-capable computer.

We interviewed a cybersecurity specialist who stated, "we simply don't have enough qualified people to meet the demand - we have client requests and commitments that already reach out five years and now it looks like the government is going to legislate action in some cases. So, some of our existing clients may be plumb out of luck."

Having watched the cybersecurity challenges over the past two decades, it should be no surprise that some companies will simply not be prepared. The key question is, ***would they survive a quantum attack?***
